Visual Tools and SureView Systems is a partnership which offers integration benefits to a global network of central stations.

Integration of Visual Tools' video recording products with Immix® alarm handling automation software opens new markets for both companies.

Madrid, Spain. November 4, 2010 –Visual Tools and SureView Systems have entered into a strategic partnership to offer customers from around the world the integration between Visual Tools' video products and the Immix® platform. This partnership enables central stations with Immix® software to offer improved video surveillance and alarm processing services to their customers.

Immix® is an automation software platform which receives alarm events from multiple industry standard CCTV and alert systems. The integration with Visual Tools' products enables users of central stations to manage and respond to alarms and events from Visual Tools' units from one single interface. Displaying live video at user's request, displaying live video when receiving an alarm, controlling domes or receiving alarms with images from installations with Visual Tools' units, are some of the actions that can be undertaken now by using Immix® graphical user interface .

To quote Chris Eckersley, Sales Director of SureView Systems: "We knew that for the Spanish customers of Immix®, the integration with Visual Tools' products was a must and therefore the integration was key to our expansion in Spain. The good news is that in many other countries Visual Tools' video products are also in demand and that we are in now in a position to offer central stations the benefits of having them integrated "

"Our products are constantly evolving and SureView is strongly committed to continuous development with them", said Juan Conejos, Product Manager of Visual Tools: "Our goal has always been to ease the work of the central stations so they can offer the best services to their customers, and the integration with Immix® is for us one more step in our strategy to achieve it"
